Abstract. Background: F-Box protein 45 (FBXO45) is reported to be associated with cancer aggressiveness. We investigated the relationship between FBXO45 and clinicopathological factors in gastric cancer (GC). Materials and Methods: We used immunohistochemistry to investigate FBXO45 expression in 104 GC samples; the prognostic value of FBXO45 was also calculated. Results: FBXO45 levels in GC were higher than in normal tissues. Patients with relatively low FBXO45 expression (n=58) had increased cancer progression and poorer prognosis than those with high expression (n=46). Low FBXO45 expression was an independent negative prognostic factor in patients with GC. Using the public Kaplan–Meier plotter database, we showed that survival in patients with low expression of FBXO45 in GC was shorter than that in those with high FBXO45 expression, regardless of lymph node metastasis. Conclusion: A low FBXO45 expression level in GC tissues may be a powerful predictor of poor prognosis. FBXO45 might, therefore, be a promising candidate for a molecular targeted therapy in GC.

Gastric cancer (GC) rates have been decreasing recently due to better management and treatment of Helicobacter pylori (1), and many patients with GC have achieved disease-free status following curative resection and postoperative adjuvant chemotherapy (2). However, the prognosis for patients with advanced disease remains poor and unsatisfactory. To improve the outcomes of individual patients, identification of reliable predictors of poor prognosis or recurrence is extremely important in patients with advanced GC. Moreover, such markers may be promising therapeutic targets for refractory GC. We previously re-analyzed the GSE13911 expression microarray data of GC and normal gastric mucosa registered with the Gene Expression Omnibus (GEO) (3) and reported specific genes that we found to be highly expressed in GC compared to normal mucosa (4). Following that microarray analysis, we focused on F-box protein 45 (FBXO45), a gene of particular interest, in this study. F-Box proteins including FBXO45 are currently drawing attention in the field of cancer research because their expression levels are associated with several cellular processes, including those that are associated with tumorigenic pathways. These include cell-cycle progression, apoptosis, transcription, migration, invasion, and metastasis (5). Some F-box family members have already been shown to be related to cancer progression and poor prognosis. GC-specific FBXO45 is part of a ubiquitin ligase complex and plays a role in neuronal development (6). Moreover, FBXO45 was reported to play a role in the degradation of tumor suppressors or cancer-related proteins via ubiquitin-mediated proteolysis (5, 7). However, the relationships between FBXO45 expression, clinicopathological factors, and prognosis have not yet been investigated in clinical cancer samples, including those of patients with GC.

In this study, we investigated the cancer-specific expression of FBXO45 by re-analyzing a GEO database. We also examined the protein expression level of FBXO45 in GC samples to determine whether it is a suitable prognostic marker, and validated our findings using a public database.
Materials and Methods

Clinical samples. We used restricted primary GC tissues from 104 patients (67 men and 37 women) who underwent potentially curative surgery at the Department of General Surgical Science, Gunma University Hospital, between 1995 and 2000. All clinical GC samples in this study were used in accordance with institutional guidelines and the Helsinki Declaration after obtaining written informed consent from all participants. The clinicopathological findings were based on surgical records and pathology reports, and were determined according to the Japanese Classification of Gastric Carcinoma outlined by the Japanese Gastric Cancer Association (8).

Immunohistochemistry. Resected surgical specimens were fixed in 10% formaldehyde, embedded in paraffin blocks, cut into 4-μm-thick sections, and mounted on glass slides. The staining procedure was performed using standard methods as described previously (9). The sections were first incubated overnight at 4°C and then at room temperature for 30 min with goat polyclonal anti-FBXO45 antibody (sc-99418; Santa Cruz Biotechnology Inc. Heidelberg, Germany) at a dilution of 1:300 in phosphate-buffered saline (PBS) containing 1% bovine serum albumin. The sections were washed in PBS and then incubated with biotinylated anti-goat secondary antibody solution (Nichirei Co., Tokyo, Japan) for 30 min at room temperature. The chromogen (3,3’-diaminobenzidine tetrahydrochloride) was applied as a 0.02% solution containing 0.005% hydrogen peroxide in a 50 mM ammonium acetate-citrate acid buffer (pH 6.0). The sections were lightly counterstained with Mayer’s hematoxylin and mounted on glass slides.

FBXO45 immunoreactivity was scored as follows: 0=no staining; score 1+=weak cytoplasmic staining; and score 2+=strong cytoplasmic staining. Immunohistochemically stained slides were examined and evaluated independently by two experienced researchers. The samples were classified into high (2+) or low (1+ and 0) expression groups.

Data mining. We used an online Kaplan–Meier plotter database to validate the association between FBXO45 mRNA expression and overall survival in patients with GC. Kaplan–Meier plotter is an entirely independent patient database comprising large-scale survival data that can be stratified by selected genes and clinicopathological factors in clinical GC samples. The correlations were performed using standard methods as described previously (9). The survival curves were plotted according to the Kaplan–Meier method, and data were compared using the log-rank test. All differences were statistically significant at the level of p<0.05. The significance of potential prognostic factors was examined by using multivariate analysis. Cox proportional hazards regression analysis was used to test the independent prognostic contribution of FBXO45 expression. Statistical analysis was performed with the JMP software package (SAS Institute Inc., Cary, NC, USA).

Results

Expression of FBXO45 in clinical GC tissues. We used immunohistochemistry to investigate the cytoplasmic expression of FBXO45 in 104 GC specimens. Representative immunohistochemical stains are shown in Figure 1. FBXO45 was more highly expressed in cancerous tissues than in corresponding non-cancerous tissues, and was predominantly expressed in the cytoplasm (Figure 1A and B). Forty-six GC specimens were classified into the high FBXO45 expression group, while 58 were classified into the low FBXO45 expression group (Figure 1B-D).

Association between FBXO45 expression and clinicopathological factors in clinical GC samples. The correlations between FBXO45 expression in the GC specimens and clinicopathological characteristics of the corresponding patients (age, sex, histological type, Lauren classification, tumor size, tumor depth, lymph node metastasis, lymphatic invasion, venous invasion, and stage) are shown in Table I. Low FBXO45 expression levels in 104 GC samples were significantly associated with poor tumor differentiation and
signet ring cell histotype \((p=0.009)\), diffuse type of Lauren classification \((p=0.0013)\), progression of tumor size \((p=0.008)\), tumor depth \((p=0.0013)\), lymph node metastasis \((p=0.0066)\), and clinical stage \((p<0.0001)\). No significant differences were observed with respect to age, sex, lymphatic invasion, and venous invasion. 

Prognostic significance of FBXO45 expression in patients with GC. The overall and cancer-specific survival rates of patients with GC with low FBXO45-expressing tumors were significantly lower than those with high FBXO45-expressing tumors \((p=0.0002\) and \(p=0.0004\), respectively; Figure 2A and B). Among patients with GC without pathological lymph
node metastasis (n=33), the prognosis was not significantly different in the low FBXO45 expression group than in the high expression group (p=0.21; Figure 2C). However, among patients with lymph node metastasis (n=71), those with low FBXO45 expression had poorer prognoses than those with high expression (p=0.007; Figure 2D). On multivariate analyses, low expression of FBXO45 in GC tissues was an independent prognostic factor for poor survival (relative Risk=1.94, 95% Confidence Interval=1.03-3.86, p=0.039), as were age and lymph node metastasis (Table II).

To validate our findings regarding the prognostic significance of FBXO45 in GC, we examined the correlation of FBXO45 mRNA expression and prognosis using the public Kaplan–Meier plotter database. Low FBXO45 mRNA expression was correlated with poor overall and progression-free survival in 631 and 522 patients with GC, respectively (p<0.0001 and p=0.00012, respectively; Figure 3A and B). In this large cohort, patients with GC with or without lymph node metastasis but low FBXO45 expression exhibited poorer prognoses than those with high FBXO45 expression (p=0.032 and p<0.0001, respectively; Figure 3C and D).

**Discussion**

In this study, we found the expression level of FBXO45 in primary GC to be higher than in corresponding normal gastric tissues, which was consistent with data from a previous expression microarray study. We showed that low relative expression levels of FBXO45 are associated with cancer progression and are an independent prognostic factor in patients with GC. We also validated the prognostic significance of low FBXO45 expression in GC, which was true regardless of lymph node metastasis status, using a public database.
Patients with GC with high FBXO45 expression had better prognoses than those with relatively low expression (although levels considered low expression FBXO45 in GC remained higher than those in normal tissue). FBXO45 functions to degrade target proteins via ubiquitination (10); therefore, it may also target cancer-related proteins. Many epithelial–mesenchymal transition (EMT)-associated proteins are substrates of FBXO45, including snail family transcriptional repressor 1 (SNAIL1), SNAIL2, twist family BHLH transcription factor 1, and zinc finger E-box binding homeobox 1; these proteins induce EMT by repressing the epithelial marker E-cadherin. In several types of cancers, EMT-induced cancer cells develop invasive phenotypes and penetrate the surrounding stromal tissues, resulting in the creation of a permissive microenvironment for cancer invasion and metastasis formation (11). Furthermore, EMT of cancer cells has been associated with resistance to chemotherapy and radiation therapy, which could give rise to recurrence and distant metastasis following standard adjuvant treatment (12). Therefore, it is plausible that the EMT that ensues owing to down-regulation of FBXO45 may be responsible for cancer aggressiveness and poor prognosis of patients with GC with low FBXO45 expression.

According to our immunohistochemical analysis and microarray data, FBXO45 expression was higher in GC than in corresponding normal tissues. FBXO45 was originally identified as an estrogen-induced F-box protein in the MCF-7 breast cancer cell line. However, there are few studies that

Figure 3. Prognostic significance of F-box protein 45 (FBXO45) expression in patients with gastric cancer (GC) in a public database. Kaplan–Meier survival curves for patients expressing a high or low level of FBXO45; adapted from KM plotter: http://kmplot.com. Overall (A) and progression-free (B) survival curves. B: Overall survival curves for patients with gastric cancer expressing high or low FBXO45; adapted from KM plotter: http://kmplot.com. Data for patients with GC without (C) and with (D) lymph node metastasis.
have examined the mechanisms of regulating FBXO45 expression. On the other hand, comparative genomic hybridization studies showed that chromosome 3q, which harbors FBXO45, was amplified in clinical GC samples (13, 14). In this study, we showed that the overexpression of FBXO45 in GC occurred in parallel at both the mRNA and protein levels. Therefore, we posit that FBXO45 expression in GC is regulated at least partly by genomic alterations.

Tools to predict the high risk of recurrence and poor prognosis are urgently needed for clinical patients with GC who undergo curative resections. It was reported that adjuvant chemotherapy for patients with lymph node metastasis of GC is effective for preventing recurrence after curative surgery (15). While patients with GC normally treated with adjuvant chemotherapy can be cured with surgery alone, adjuvant therapy is still recommended for those with lymph node metastasis. Adjuvant chemotherapy has contributed to the decline of GC recurrence rates, but not sufficiently. In this study, we found that low cytoplasmic FBXO45 expression in GC tissues correlated with poor prognosis on subgroup analysis of patients with lymph node metastasis. Hence, low FBXO45 may be predictive of a higher risk of GC recurrence in patients with lymph node metastasis who are recommended for adjuvant therapy. Such a marker would therefore be critical for developing personalized treatments for patients according to their risk assessment.

In conclusion, we showed that relatively low FBXO45 expression in GC tissues is associated with cancer progression and constitutes an independent prognostic factor. The evaluation of FBXO45 in GC tissues might, therefore, be crucial for predicting aggressive phenotypes and poor prognoses in patients with GC. Further studies are warranted to evaluate the role of FBXO45 and its clinical application in GC treatment.

Received November 14, 2016
Revised December 5, 2016
Accepted December 6, 2016
Instructions for Authors 2017

General Policy. ANTICANCER RESEARCH (AR) will accept original high quality works and reviews on all aspects of experimental and clinical cancer research. The Editorial Policy suggests that priority will be given to papers advancing the understanding of cancer causation, and to papers applying the results of basic research to cancer diagnosis, prognosis, and therapy. AR will also accept the following for publication: (a) Abstracts and Proceedings of scientific meetings on cancer, following consideration and approval by the Editorial Board; (b) Announcements of meetings related to cancer research; (c) Short reviews (of approximately 120 words) and announcements of newly received books and journals related to cancer, and (d) Announcements of awards and prizes.

The principal aim of AR is to provide prompt publication (print and online) for original works of high quality, generally within 1-2 months from final acceptance. Manuscripts will be accepted on the understanding that they report original unpublished works in the field of cancer research that are not under consideration for publication by another journal, and that they will not be published again in the same form. All authors should sign a submission letter confirming the approval of their article contents. All material submitted to AR will be subject to peer-review, when appropriate, by two members of the Editorial Board and by one suitable outside referee. All manuscripts submitted to AR are urgently treated with absolute confidence, with access restricted to the Managing Editor, the journal’s secretary, the reviewers and the printers. The Editors reserve the right to improve manuscripts on grammar and style.

The Editors and Publishers of AR accept no responsibility for the contents and opinions expressed by the contributors. Authors should warrant due diligence in the creation and issuance of their work.

NIH Open Access Policy. The journal acknowledges that authors of NIH-funded research retain the right to provide a copy of the published manuscript to the NIH four months after publication in ANTICANCER RESEARCH, for public archiving in PubMed Central.

Copyright. Once a manuscript has been published in ANTICANCER RESEARCH, which is a copyrighted publication, the legal ownership of all published parts of the paper has been transferred from the Author(s) to the journal. Material published in the journal may not be reproduced or published elsewhere without the written consent of the Managing Editor or Publisher.

Format. Two types of papers may be submitted: (i) Full papers containing completed original work, and (ii) review articles concerning fields of recognisable progress. Papers should contain all essential data in order to make the presentation clear. Reasonable economy should be exercised with respect to the number of tables and illustrations used. Papers should be written in clear, concise English. Spelling should follow that given in the “Shorter Oxford English Dictionary”.

Manuscripts. Submitted manuscripts should not exceed fourteen (14) pages (approximately 250 words per double – spaced typed page), including abstract, text, tables, figures, and references (corresponding to 4 printed pages). Papers exceeding 4 printed pages will be subject to excess page charges. All manuscripts should be divided into the following sections: (a) First page including the title of the presented work [not exceeding fifteen (15) words], full names and full postal addresses of all Authors, name of the Author to whom proofs are to be sent, key words, an abbreviated running title, an indication “review”, “clinical”, “epidemiological”, or “experimental” study, and the date of submission. (Note: The order of the Authors is not necessarily indicative of their contribution to the work. Authors may note their individual contribution(s) in the appropriate section(s) of the presented work); (b) Abstract not exceeding 150 words, organized according to the following headings: Background/Aim – Materials and Methods/Patients and Methods – Results – Conclusion; (c) Introduction; (d) Materials and Methods/Patients and Methods; (e) Results; (f) Discussion; (g) Acknowledgements; (h) References. All pages must be numbered consecutively. Footnotes should be avoided. Review articles may follow a different style according to the subject matter and the Author’s opinion. Review articles should not exceed 35 pages (approximately 250 words per double-spaced typed page) including all tables, figures, and references.

Figures. All figures should appear at the end of the submitted document file. Once a manuscript is accepted all figures and graphs should be submitted separately in either jpg, tiff or pdf format and at a minimum resolution of 300 dpi. Graphs must be submitted as pictures made from drawings and must not require any artwork, typesetting, or size modifications. Symbols, numbering and lettering should be clearly legible. The number and top of each figure must be indicated. Pages that include color figures are subject to color charges.

Tables. All tables should appear at the end of the submitted document file. Once a manuscript is accepted, each table should be submitted separately, typed double-spaced. Tables should be numbered with Roman numerals and should include a short title.

**Clinical Trials.** Authors of manuscripts describing clinical trials should provide the appropriate clinical trial number in the correct format in the text.

For International Standard Randomised Controlled Trials (ISRCTN) Registry (a not-for-profit organization whose registry is administered by Current Controlled Trials Ltd.) the unique number must be provided in this format: ISRCTNXXXXXXXX (where XXXXXXXXX represents the unique number, always prefixed by “ISRCTN”). Please note that there is no space between the prefix “ISRCTN” and the number. Example: ISRCTN47956475.

For Clinicaltrials.gov registered trials, the unique number must be provided in this format: NCTXXXXXXXX (where XXXXXXXXX represents the unique number, always prefixed by ‘NCT’). Please note that there is no space between the prefix ‘NCT’ and the number. Example: NCT00001789.

**Ethical Policies and Standards.** ANTICANCER RESEARCH agrees with and follows the “Uniform Requirements for Manuscripts Submitted to Biomedical Journals” established by the International Committee of Medical Journal Editors in 1978 and updated in October 2001 (www.icmje.org). Microarray data analysis should comply with the “Minimum Information About Microarray Experiments (MIAME) standard”. Specific guidelines are provided at the “Microarray Gene Expression Data Society” (MGED) website. Presentation of genome sequences should follow the guidelines of the NHGRI Policy on Release of Human Genomic Sequence Data. Research involving human beings must adhere to the principles of the Declaration of Helsinki and Title 45, U.S. Code of Federal Regulations, Part 46, Protection of Human Subjects, effective December 13, 2001. Research involving animals must adhere to the Guiding Principles in the Care and Use of Animals approved by the Council of the American Physiological Society. The use of animals in biomedical research should be under the careful supervision of a person adequately trained in this field and the animals must be treated humanely at all times. Research involving the use of human foetuses, foetal tissue, embryos and embryonic cells should adhere to the U.S. Public Law 103-41, effective December 13, 2001.

**Submission of Manuscripts.** Please follow the Instructions for Authors regarding the format of your manuscript and references. Manuscripts must be submitted only through our online submission system at: http://www.iiar-submissions.com/login.html In case a submission is incomplete, the corresponding Author will be notified accordingly. Questions regarding difficulties in using the online submission system should be addressed to: email: journals@iiar-anticancer.org

**Galley Proofs.** Unless otherwise indicated, galley proofs will be sent to the corresponding Author of the submission. Corrections of galley proofs should be sent by typographical errors. Reprints, PDF files, and/or Open Access may be ordered after the acceptance of the paper. Authors of online open access articles are entitled to a complimentary online subscription to Anticancer Research for the current year and all previous digital content since 2004. Requests should be addressed to the Editorial Office. Galley proofs should be returned corrected to the Editorial Office by email within two days.

**Specific information and additional instructions for Authors**

1. Anticancer Research (AR) closely follows the new developments in all fields of experimental and clinical cancer research by (a) inviting reviews on topics of immediate importance and substantial progress in the last three years, and (b) providing the highest priority for rapid publication to manuscripts presenting original results judged to be of exceptional value. Theoretical papers will only be considered and accepted if they bear a significant impact or formulate existing knowledge for the benefit of research progress.

2. Anticancer Research will consider the publication of conference proceedings and/or abstracts provided that the material submitted fulfils the quality requirements and instructions of the journal, following the regular review process by two suitable referees.

3. An acknowledgement of receipt, including the article number, title and date of receipt is sent to the corresponding author of each manuscript upon receipt. If this receipt is not received within 20 days from submission, the author should call or write to the Editorial Office to ensure that the manuscript (or the receipt) was not lost in the mail or during electronic submission.

4. Each manuscript submitted to AR is sent for review in confidence to two suitable referees with the request to return the manuscript with their comments to the Editorial Office within 12 days from receipt. If reviewers need a longer time or wish to send the manuscript to another expert, the manuscript may be returned to the Editorial Office with a delay. All manuscripts submitted to AR, are treated in confidence, without access to any person other than the Managing Editor, the journal’s secretary, the reviewers and the printers.
5. All accepted manuscripts are peer-reviewed and carefully corrected in style and language, if necessary, to make presentation clear. (There is no fee for this service). Every effort is made (a) to maintain the personal style of the author’s writing and (b) to avoid change of meaning. Authors will be requested to examine carefully manuscripts which have undergone language correction at the pre-proof or proof stage.

6. Authors should pay attention to the following points when writing an article for AR:

- The Instructions to Authors must be followed in every detail.
- The presentation of the experimental methods should be clear and complete in every detail facilitating reproducibility by other scientists.
- The presentation of results should be simple and straightforward in style. Results and discussion should not be combined into one section, unless the paper is short.
- Results given in figures should not be repeated in tables.
- Figures (graphs or photographs) should be prepared at a width of 8 or 17 cm with legible numbers and lettering.
- Photographs should be clear with high contrast, presenting the actual observation described in the legend and in the text. Each legend should provide a complete description, being self-explanatory, including technique of preparation, information about the specimen and magnification.
- Statistical analysis should be elaborated wherever it is necessary. Simplification of presentation by giving only numerical or % values should be avoided.
- Fidelity of the techniques and reproducibility of the results, should be points of particular importance in the discussion section. Authors are advised to check the correctness of their methods and results carefully before writing an article. Probable or dubious explanations should be avoided.
- Authors should not cite results submitted for publication in the reference section. Such results may be described briefly in the text with a note in parenthesis (submitted for publication by… authors, year).
- The References section should provide as complete a coverage of the literature as possible including all the relevant works published up to the time of submission.
- By following these instructions, Authors will facilitate a more rapid review and processing of their manuscripts and will provide the readers with concise and useful papers.

7. Following review and acceptance, a manuscript is examined in language and style, and galley proofs are rapidly prepared. Second proofs are not sent unless required.

8. Authors should correct their galley proofs very carefully and preferably twice. An additional correction by a colleague always proves to be useful. Particular attention should be paid to chemical formulas, mathematical equations, symbols, medical nomenclature etc. Any system of correction marks can be used in a clear manner, preferably with a red pen. Additions or clarifications are allowed provided that they improve the presentation but do not bring new results (no fee).

9. Articles submitted to AR may be rejected without review if:

- they do not fall within the journal's policy.
- they do not follow the instructions for authors.
- language is unclear.
- results are not sufficient to support a final conclusion.
- results are not objectively based on valid experiments.
- they repeat results already published by the same or other authors before the submission to AR.
- plagiarism is detected by plagiarism screening services.

(Rejection rate (2016): 66%).

10. Authors who wish to prepare a review should contact the Managing Editor of the journal in order to get confirmation of interest in the particular topic of the review. The expression of interest by the Managing Editor does not necessarily imply acceptance of the review by the journal.

11. Authors may inquire information about the status of their manuscript(s) by calling the Editorial Office at +30-22950-53389, Monday to Friday 9.00-16.00 (Athens time), or by sending an e-mail to journals@iiar-anticancer.org

12. Authors who wish to edit a special issue on a particular topic should contact the Managing Editor.

13. Authors, Editors and Publishers of books are welcome to submit their books for immediate review in AR. There is no fee for this service. (This text is a combination of advice and suggestions contributed by Editors, Authors, Readers and the Managing Editor of AR).
